

Install Docker on Ubuntu

Install Docker

```
sudo apt-get update
```

(This updates the package index on your system to ensure you have the latest information about available packages)

```
sudo apt-get install ca-certificates curl
```

(This installs the ca-certificates and curl packages, which are required for the next steps)

```
sudo install -m 0755 -d /etc/apt/keyrings
```

(This creates a directory /etc/apt/keyrings with the appropriate permissions to store the Docker GPG key)

```
sudo curl -fsSL https://download.docker.com/linux/ubuntu/gpg -o  
/etc/apt/keyrings/docker.asc
```

(This downloads Docker's official GPG key and saves it to /etc/apt/keyrings/docker.asc)

Install Docker

```
sudo chmod a+r /etc/apt/keyrings/docker.asc
```

(This sets the read permission for the GPG key file so that it can be read by the package management system)

```
echo \
```

```
"deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.asc]  
https://download.docker.com/linux/ubuntu \  
$(. /etc/os-release && echo "$VERSION_CODENAME") stable" | \  
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

(This command adds the Docker repository to your system's Apt sources list. It dynamically determines your system's architecture and Ubuntu version to ensure you get the appropriate packages for your system)

```
sudo apt-get update
```

(This updates the package index again to include the newly added Docker repository)

Install Docker

```
sudo apt-get install docker-ce docker-ce-cli containerd.io docker-buildx-plugin docker-compose-plugin
```

(This will install Docker Engine, the Docker command-line interface (CLI), the containerd runtime, and the Docker Compose plugin on your system)

Verify Docker Installation

docker version

Add User to Docker Group

```
sudo usermod -aG docker ${USER}
```
